Turn pilot usage into a clearer rollout plan.

Connect the users you expect to enable with the credits they may need. See when prepaid coverage could run short—before your next expansion or funding decision.

Your usage baseline
Users + monthly credits per user

→

Your rollout scenario
Growth + expansion + purchases

→

A funding conversation
Credit demand + coverage + cost

Make the next decision easier to discuss.

01 See when coverage runs short

View prepaid drawdown and pay-as-you-go need month by month. Discuss purchase timing as well as the total credits required.

02 Make rollout waves visible

Plan a new department, region or user cohort as a dated step-up. See how an expansion changes demand and funding needs.

03 Explore what could change

Adjust user and usage growth, or compare low/base/high usage scenarios. Make uncertain assumptions visible rather than hiding them in one number.

04 Bring the same plan to your team

Use Excel with editable inputs and live formulas for a working session. Use the executive PowerPoint export for finance and business discussions.

Best time to use it

You have pilot usage and a decision ahead: an expansion, a credit purchase or a funding review. For a first purchase without usage history, start with the Credit Estimator instead.

Start with one question. Not a commitment.

Not ready with your own figures? Explore an illustrative scenario first. You do not need a finalized rollout or purchase decision to see how the model works.

1 Set a starting point **2** Add one rollout wave **3** Review the first coverage gap

Explore one scenario →

No file upload is required to model a scenario.
The tool does not make a purchase or enforce spend.

Before relying on results, replace sample values with measured usage and agreed rates. Estimates are not invoices or guaranteed savings; taxes, fees, credit expiry and other contract terms are not modeled. Inputs are processed in your browser; review exports and follow your data-handling policies.
